

**Listing of Claims:**

1. (Currently amended) A sheet flashing member (1) comprising:

a sheet section (40) defining a plane and including a main portion (10) as well as first and second corner segments (20, 30), the main portion extending along a portion of a roof penetrating structure and the corner segments extending along other portions of the roof penetrating structure perpendicularly to the main portion, and

at least one flange (11, 21) arranged at an angle relative to the plane of the sheet section and adapted to engage a surface of a roof penetrating building structure,

wherein at least one of said corner segments at a surface thereof comprises at least one indication (22, 32, 34, 38) comprising a weakening section ~~indicating a pattern~~, such that at least a part of the sheet section is separable from the remaining part of the flashing member along the at least one indication ~~indications~~ in order to transform the respective corner segment from an initial state to a transformed state.

2. (Currently amended) The sheet flashing member as defined in claim 1, wherein ~~each~~ said at least one indication (22, 32, 34, 38) comprises a visual indication in the shape of at least one longitudinally extending line or a longitudinally extending row of dots or line sections.

3. Cancelled

4. (Currently amended) The sheet flashing member as defined in claim 1 ~~3~~, wherein said weakening section ~~sections~~ includes at least one groove.

5. (Previously presented) The sheet flashing member as defined in claim 4, wherein said groove is formed by depression.

6. (Currently amended) The sheet flashing member as defined in claim 1 ~~3~~, wherein said weakening section comprises ~~sections comprise~~ a longitudinally extending cord member accommodated in the corner segment (20, 30).

7. (Previously presented) The sheet flashing member as defined in claim 1, wherein the pattern defines one or more indications delimiting an area (26, 37) of an end portion (20, 30) which, when separation has taken place, is able to be removed.

8. (Previously presented) The sheet flashing member as defined in claim 1, wherein the sheet section (40) has a general longitudinal orientation, the pattern defining at least one indication (38) arranged at an oblique angle relative to the general longitudinal orientation, the oblique indication being directly or indirectly connected to a free edge (33, 35) of the sheet section.

9. (Previously presented) The sheet flashing member as defined in claim 1, wherein the sheet section (40) includes a main portion (10), and first and second end portions define first and second corner segments (20, 30), the main portion comprising an upstanding flange (11) and the first and second corner segments comprising first and second flanges (21, 31) arranged substantially perpendicularly to the upstanding flange, the flanges (11, 21, 31) being adapted to engage a longitudinal surface portion of a roof penetrating building structure as well as its

associated corner portions.

10. (Previously presented) The sheet flashing member as defined in claim 9, further comprising a skirt element (50) which is adapted to engage an upper roof surface.

11. (Previously presented) The sheet flashing member as defined in claim 9, wherein the first corner segment (20) comprises an indication (22) arranged across the width thereof and generally perpendicularly to the general longitudinal orientation, and wherein the second corner segment (30) comprises first and second indications (32, 34) defining a portion (37), and a third indication (38) arranged at an oblique angle relative to the general longitudinal orientation and connected to said portion.

12. (Previously presented) The sheet flashing member as defined in claim 10, wherein the first corner segment (20) comprises an indication (22) arranged across the width thereof and generally perpendicularly to the general longitudinal orientation, and wherein the second corner segment (30) comprises first and second indications (32, 34) defining a portion (37), and a third indication (38) arranged at an oblique angle relative to the general longitudinal orientation and connected to said portion.
